	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Be able to use the Purdue API to retrieve daily dining court menus and available nutritional information. ● Allow users to enter their weight, fitness goal (bulking, cutting, or maintenance), and daily calorie and protein targets. ● Generate a meal schedule based on available dining court food, nutritional targets, and a manually entered class schedule, with two modes: balanced protein and convenience, or protein maximization.	**Schedule - (For V2.0+)** ● Send the generated meal plan to the user's phone every morning using a messaging API. ● Import schedules from Google Calendar instead of requiring manual entry. ● Use an optimization algorithm to select the best combination of meals for the entire day while considering calories, protein, convenience, and travel time.
Not Important	**Delegate - (Use a library)** ● Use libcurl to retrieve menu data from Purdue rather than implementing HTTP networking from scratch. ● Use nlohmann/json to parse API responses and read user profiles, class schedules, and external food logs.	**Delete - (Cut it)** ● AI chatbot for nutrition advice. ● Social features and leaderboards.
